
IGitt Documentation

Release 0.4.1

The IGitt Developers

Apr 22, 2018

1	Why do I Need This?	3
2	Installation	5
3	Quickstart	7
4	API Documentation	9
5	Indices and tables	11

IGitt is a Git hoster abstraction. It is one python API that allows you to rule over GitHub, GitLab and more hosting platforms.

CHAPTER 1

Why do I Need This?

If you want to support more than one hoster it doesn't mean that you want to implement all your API requests multiple times. With IGitt you can create e.g. a `GitHubIssue` object and use it the same way as a `GitLabIssue` object.

Stop worrying about multiple platforms :)

CHAPTER 2

Installation

```
pip install IGitt
```

CHAPTER 3

Quickstart

All classes follow the APIs given in *IGitt.Interfaces*. Here's an example on how to set labels on a GitHub issue:

```
from IGitt.GitHub.GitHubIssue import GitHubToken, GitHubIssue
issue = GitHubIssue(GitHubToken("YOUR TOKEN"), "ORG/REPO", NUMBER)

issue.labels = {"type/bug", "area/core"}
```

CHAPTER 4

API Documentation

CHAPTER 5

Indices and tables

- `genindex`
- `modindex`
- `search`
